DETAILED ACTION

Allowable Subject Matter

1. Claims 1-12 are allowed.
2. The following is an examiner's statement of reasons for allowance:

None of the prior art teaches or suggest that a method and a device for fast and synchronization of multiframe structures. Detecting a period binary signature in a binary signal transmitted at a particular bit rate. The signature forming a pre-selected binary code having a code length of "C" binary symbols spread over the signal with a known spacing "D" of bits between the binary symbols of the signature as well as between adjacent signatures; the device comprising: a state machine including a logical interconnected with a memory block, the memory block of the state machine comprising "D" independent memory cells each having its serial number, the memory cells being cyclically connectable to the logical scheme; each of the memory cells, when in conjunction with the logical scheme, being capable of registering "K" successive binary states of the state machine including an initial state and a terminal state; "K" states comprising "C" successive binary states respectively associated with "C" binary symbols of the code successively appearing in said signature; a control unit responsible for switching said logical scheme to D memory cells according to their serial numbers and in a cyclical manner at a rate equal to the bit rate of said signal so that, a different memory cell is connected to the logic scheme at each of the time clocks within a group of D time clocks, the control unit being further capable continuously checking whether at least one cell of the "D" memory cells has registered the terminal state, and of selecting

therefrom a single one considered as detecting the signature; the arrangement being such that, if one and the same initial binary state is assigned to all the cells in the memory block, and if said binary signal is applied to the state machine at its bit rate, each bit in any group of D successive bits of the binary signal will be processed using a particular cell of the memory cells, thereby associating each of the memory cells with a particular bit in any group of D successive bits and allowing a periodic signature formed by a particular bit within said successive bits to be detected by the respective particular memory cell of D cells, wherein: "C" - is an integer which is a number of binary positions of the periodic binary signature, "D" - is an integer, the integer being a) a number of binary positions of the binary signal forming the spacing between adjacent binary symbols of the periodic binary signature, and b) a number of independent memory cells, "K" - is an integer which is a number of successive binary states of the state machine, "K" being no less than "C".

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
